

# Seedling Maintenance

By Edwin and Sofia

**STEP ONE:** How do you maintain a seedling? The first thing to do is make sure you water your seedlings every day. The way to know to water them is by putting your finger in the dirt. If the soil is dry you put a medium amount of water in, if the water is moist you put a small amount of water in.

**STEP TWO:** Sunlight is important for seedlings because it gives them energy. Make sure that the seedlings get enough sunlight.

**STEP THREE:** Pruning is important and is involves cutting off dead or dry plants. Seedlings need to be pruned because if you don't cut off any discolored leaves the rest get discolored and ugly.

**STEP FOUR:** Next, we're talking about termites. Check if there is any brown or red bugs near your seedlings because certain bugs can harm the growth of your plants by eating them.

**STEP FIVE:** At last we're talking about fertilizer. fertilizer is food for plant. There are two types of fertilizer that look like rocks and there are some that have fish in it. Mostly, fertilizer just looks like soil.
